I site by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The cDNA vector was circularized with E. coli DNA ligase after digestion of ECOR which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli ToplOF' by electroporation method. The cDNA libraries constructed by this method are full-length enriched cDNA library."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             BMB43274 597 bp mRNA linear BST 06-MAR-2002 K-EST0121093 S14K402 Homo gapieng cDNA clone S14K402-31-E12 5',

/clone="Organ: Pooled-Skin; Vector: pDNR-LIB; Site 1: SfiI (ggccattatggcc); Site 2: SfiI (ggccgcctcggcc); Library is oligo-dT primed and directionally cloned. cDNR was prepared from a pooled samples of tissues from Skin, meninges, duramatter, pia matter and choroid plexus.

and 3: adaptores were used in cloning as follows: S. adaptor sequence: S.-CACGGCCATARYGGCC-3' and 3' adaptor sequence: S.-ATTCTAGAGGCCGAGGCGCATG-dT(30)BN-3' (where B = A, C, or G and N = A, C, or J). Average insert size 1.47 kb (range 0.50-4.0 kb). 15/15 colonies contained inserts by PCR. This library was enriched for full-length clones and was constructed by Clontech Laboratories (Palo Alto, CA). Note: this is a NIH_MGC Library"

/note="Organ: Storeach; Vector: pTz18RP1; Site_1: EcoRI;
Site_2: Not1; The poly (A) + RNA was dephosphorylated with
bacterial alkaline phosphatase (BAP) and then decapped
with tabacco acid pyrophosphatase (TAP). The decapped
with tabacco acid pyrophosphatase (TAP). The decapped
intact mRNA was sligated with DNA-RNA linker including EcoR
I site by treatment of T4 RNA ligase and the first strand
cDNA was synthesized from oligo dT-selected mRNA by
priming with dT-tailed vector. The GTA vector was
adjusted to have about 60nt. The cDNA vector was
circularized with E. coll DNA ligase after digestion of
EcoRI which site is also included in vector. An RNA strand
converted to a DNA strand by Okayam-Berg method. The
obtained cDNA vectors were used for transformation of
competent cells E. coll Top10F' by electroporation method.
The cDNA libraries constructed by this method are
full-length enriched cDNA library."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EST 01-MAY-2003

priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The CDNA vector was circularized with E. Coli DNA ligase after digestion of ECORI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The converted to a DNA strand by Okayama-Berg method. The convertent cells E. coli ToplOf' by electroporation method. The CDNA libraries constructed by this method are full-length enriched CDNA library."

/nctce="Organ: Lung: Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site_1: ECoR I; Site_2: Not I; U1-CF-EN1 is a normalized CDNA library contending the following tissue (a): Primary Lung Cystic Fibrosis Epithelial Cells. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-886, 1996. First strand CDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded CDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonacleotide used to prime the synthesis of first-strand CDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CTGCTCAGGT.

U1-CF-ENI is a normalized CDNA library containing the
following tisgue(e): Primary Lung Cystic Fibrosis
Epithelial Cells. The library was constructed according to
Bonaldo, Lennon and Soares, Genome Research, 6:791-806,
1956. First strand CDNA synthesis was primed with an
oligo-dT primer containing a Not I site. Double stranded
CDNA was ligated to an ECoR I adaptor, disested with Not
I, and cloned directionally into pT7T3-Pac vector. The
oligonuclactide used to prime the synthesis of
first-strand cDNA contains a library tag sequence that is
located between the Not I site and the (dT)18 tail. The
sequence tag for this library is CTGTCAGGT.

Site 2: Not1; The poly (A)+ RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including ECORI site by treatment of T4 RNA ligase and the first strand CDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The cdT-tailed vector was adjusted to have about 60nt. The cDNA vector was circularized with E. coli DNA ligase after digestion of ECORI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The convertent cells E. coli Toplof' by electroporation of competent cells E. coli Toplof' by electroporation method. The cDNA libraries constructed by this method are full-length enriched CDNA library."

UI-E-CII-afp-h-21-0-UI.r2 UI-E-CII Homo sapiens cDNA clone
UI-E-CII-afp-h-21-0-UI 5', mRNA sequence.
adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is ACCTA. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."

ECORI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli ToplOF' by electroporation method. The cDNA libraries constructed by this method are full-length enriched cDNA library."

/clone="Organ: Cervix, Vector: pCNS-D2; Site_l: EcoRI;
Site_2: Not!; The poly (A) + RNA was dephosphorylated with
bacterial alkaline phosphatase (RAP) and then decapped
with tabacco acid pyrophosphatase (RAP). The decapped
intext mRNA was ligated with DNA-RNA linker including
EcoRI site by treatment of T4 RNA ligase and the first
strand cDNA was synthesized from oligo dT-selected mRNA by
priming with AT-tailed vector. The dT-tailed vector was
adjusted to have about 60mt. The cDNA vector was
circularized with E. coli DNA ligase after digestion of
